

We need to add a data design document to represent our schemas

Design challenges -- we need to add implementation challenges but the existing ones are ok

### **Agenda Item 3.** Daylight Savings Time bug

- Universal Time may be helpful
- Represent times as minutes after midnight; use a Date object to encode all this info
- Team members discussed the possibility of a “millisecond issue” causing the bug
- Something (not written) in Schema is integer
  - Add an offset per workplace -- some workplaces may have daylight savings time and some might not, for instance

We mentioned that we updated our representation for shifts.

We acknowledged that linking shifts was space efficient, but for a project of a small or medium scale this shouldn't have been our focus.

- Update this challenge our data design document
- Adding our new option to the challenge should be sufficient

Templating in ejs should be relegated to a library such as handlebars

Partials in handlebars update automatically!

Front end needs more comments -- right now it's hacky
